B.P.C.

During the last week of December 1949, SMV Director SIDOROV made an inspection tour of all SMV oil fields in Austria.\* SIDOROV singled out Austrian employees of the SMV for a stern reprimand; he warned them to expect drastic punitive measures unless SMV oil production increases insediately. SIDOROV was particularly annoyed by conditions at the E.P.G. fields, where water seepage now averages about 85 percent and one well has a water content as high as 89 percent. At present SMV obtains only 210 tons of crude oil from E. P. G. wells which produce a total of 1,550 aubic meters of oil and water per day. SIDOROV and other SMV officials seem to be convinced that Austrian oil field workers are watering this field and to check this type of sabotage they assigned a Soviet control officer to E. P. G. shortly after SIDOROV's visit.

## Muchlberg

- 5. Muchberg production dropped to an average of 950 to 1,000 tons per day sometime towards the end of November and during the first part of December 1949. This decrease is probably the result of large beams which Soviet Director N.K. KOTOV installed at Muchberg's most productive wells just before he returned to the Soviet Union on leave. SIDONOV, however, reprimanded P. A. PENDPELITSIN, Soviet director of ITAG who is supervising Muchberg during KOTOV's absence, because he has not been able to increase Muchberg production.
- 6. The SMV is now pumping oil from Muchlberg to a small railroad siding at Bernhardathal which has not been used since early in 1945. This railroad yard has a capacity for loading about 16 tank cars. It is believed that the SMV is shipping crude oil directly from Bernhardathal to the CSR.

## DEA/I

25X1A

	Recently, the SMV Central Warehouse received three new large German-made gas-compressors. These gas-compressors are to be sent to DEA/I where they may be used to increase pressure on the gas line to Vienna or to pressurize and thereby increase the output of DEA/I oil wells.
